## Sheet 1

1. (a) Prove that  $\mathbb{F}_p = \{0, 1, \dots, p-1\}$ , the set of equivalence classes of integers modulo a prime p, satisfies the axioms of a field. How many elements are there in a vector space of dimension n over the field  $\mathbb{F}_p$ ?

(Unlike the question, I am trying to use notation that distinguishes between integers and their equivalence classes.)

Let  $a, b, c \in \mathbb{Z}$  with  $0 \le a < p$ ,  $0 \le b < p$ ,  $0 \le c < p$ .

Let  $\overline{a}, \overline{b}, \overline{c} \in \mathbb{F}$  be equivalence classes of integers modulo p.

The field axioms are listed below, together with proof that they hold for  $\mathbb{F}_p$ .

#### 1. Additive axioms

Define  $\overline{a} + \overline{b} := \overline{a+b}$ , then:

- (a) Existence of identity:  $\overline{0}$  is the identity since  $\overline{a} + \overline{0} = \overline{a+0} = \overline{a}$  for all  $\overline{a} \in \mathbb{F}_p$ .
- (b) Existence of inverses:  $(\overline{a})^{-1} = \overline{-a}$  since  $\overline{a} + \overline{-a} = \overline{a} + \overline{-a} = \overline{0}$  for all  $a \in \mathbb{F}_p$ .
- (c) Commutativity:  $\overline{a} + \overline{b} = \overline{a+b} = \overline{b} + \overline{a}$  for all  $a, b \in \mathbb{F}_p$ .
- (d) Associativity:  $\overline{a} + (\overline{b} + \overline{c}) = \overline{a} + \overline{b} + \overline{c} = \overline{a+b+c} = \overline{a+b} + \overline{c} = (\overline{a} + \overline{b}) + \overline{c}$ .

# 2. Multiplicative axioms

Define  $\overline{a} \ \overline{b} := ab$ , then:

(a) Existence of identity:  $\overline{1}$  is the identity since  $\overline{a}\overline{1} = \overline{a \cdot 1} = \overline{a}$  for all  $\overline{a} \in \mathbb{F}_p$ .

(b) Existence of inverses for everything except additive identity:

The claim is that for all  $\overline{a} \in \mathbb{F}_p \setminus \{\overline{0}\}$  there exists  $\overline{b} \in \mathbb{F}_p$  such that  $\overline{a} \ \overline{b} = \overline{1}$ . Fix an arbitrary  $a \in \{1, \dots, p-1\}$ .

The claim is equivalent to the following: there exists  $b \in \{0, 1, ..., p\}$  such that for all  $i, j \in \mathbb{Z}$  there exists  $k \in \mathbb{Z}$  such that (ip + a)(jp + b) = kp + 1.

But note that (ip + a)(jp + b) = p(ijp + aj + bi) + ab and therefore

$$(ip+a)(jp+b) = kp+1$$
  
$$\iff ab = p(k-ijp-aj-bi)+1.$$

Since k can be chosen freely, the condition is simply that for all  $i, j \in \mathbb{Z}$  there exists  $k \in \mathbb{Z}$  such that ab = kp + 1.

Note<sup>a</sup> that a and p are coprime (gcd is 1). By Bezout's identity, there exists  $b, -k \in \mathbb{Z}$  such that

$$ba + (-k)p = 1 \iff ab = kp + 1.$$

- (c) Commutativity:  $\overline{a}\ \overline{b} = \overline{ab} = \overline{b}\ \overline{a}$  for all  $a, b \in \mathbb{F}_p$ .
- (d) Associativity:  $\overline{a}(\overline{b}\overline{c}) = \overline{a} + \overline{bc} = \overline{abc} = \overline{ab} \ \overline{c} = (\overline{a} \ \overline{b})\overline{c}$ .

#### 3. Distributive axiom

(a) <u>Multiplication</u> distributes over addition:  $\overline{a}(\overline{b} + \overline{c}) = \overline{a}(\overline{b+c}) = \overline{a(b+c)} = \overline{ab+ac} = \overline{ab} + \overline{ac} = \overline{a} \overline{b} + \overline{a} \overline{c}$ 

There are  $p^n$  elements in a vector space of dimension n over the field  $\mathbb{F}_p$ .

### (b) Determine all subspaces of $(\mathbb{F}_2)^3$ .

*Remark*: This is like the 8 vectors that form the unit cube in  $\mathbb{R}^3$ , except that when extended beyond the cube by vector addition or scalar multiplication they "wrap around".

 $<sup>^</sup>a$ I eventually allowed myself to google for a hint here which brought up people pointing to Bezout's identity.

Note that

$$\begin{split} (\mathbb{F}_2)^3 &= \{\overline{0},\overline{1}\}^3 \\ &= \{(\overline{0},\overline{0},\overline{0}),\\ (\overline{0},\overline{0},\overline{1}),\\ (\overline{0},\overline{1},\overline{0}),\\ (\overline{0},\overline{1},\overline{1}),\\ (\overline{1},\overline{0},\overline{0}),\\ (\overline{1},\overline{0},\overline{1}),\\ (\overline{1},\overline{1},\overline{0}),\\ (\overline{1},\overline{1},\overline{1})\}. \end{split}$$

The set of subspaces of  $(\mathbb{F}_2)^3$  is

2. Show that the vector space of polynomials  $\mathbb{R}[x]$  is isomorphic to a proper subspace of itself.

We need to:

1. Exhibit a proper subspace  $S[x] \subset \mathbb{R}[x]$  and a bijection  $f : \mathbb{R}[x] \to S[x]$ 

Let  $a_i \in \mathbb{R}$  for i = 0, 1, 2, ... so that  $\mathbb{R}[x] = \{a_0 + a_1 x^1 + a_2 x^2 + ...\}.$ 

Define  $S[x] = \{0 + a_1x^1 + a_2x^2 + a_3x^3 + \ldots\}$ , i.e. the restriction of  $\mathbb{R}[x]$  to those polynomials that have constant term zero.

S[x] is a proper subspace of  $\mathbb{R}[x]$  since it contains the zero polynomial, and is closed under addition and scalar multiplication.

Define  $f: \mathbb{R}[x] \to S[x]$  where  $f(a_0 + a_1 x^1 + a_2 x^2 + \ldots) = 0 + a_0 x^1 + a_1 x^2 + a_2 x^3 + \ldots$ 

f is clearly injective, since if f(r(x)) = f(r'(x)) then their coefficients  $a_0, a_1, \ldots$  are the same and hence r(x) = r'(x).

Also, f is clearly surjective since if  $s(x) = a_1x^1 + a_2x^2 + a_3x^3 + ...$  then  $s(x) = f(a_1 + a_2x^1 + a_3x^2 + ...)$ .

### 2. Prove that f preserves addition

Let  $a_i, b_i \in \mathbb{R}$  for  $i = 0, 1, 2, \dots$ 

Let 
$$r(x) = a_0 + a_1 x^1 + a_2 x^2 + \dots$$
 and  $r'(x) = b_0 + b_1 x^1 + b_2 x^2 + \dots$ 

Then

$$f(r(x) + r'(x)) = f((a_0 + b_0) + (a_1 + b_1)x^1 + (a_2 + b_2)x^2 + \dots)$$

$$= 0 + (a_0 + b_0)x^1 + (a_1 + b_1)x^2 + (a_2 + b_2)x^3 + \dots$$

$$= (0 + a_0x^1 + a_1x^2 + a_2x^3 + \dots)$$

$$+ (0 + b_0x^1 + b_1x^2 + b_2x^3 + \dots)$$

$$= f(r(x)) + f(r'(x)).$$

### 3. Prove that f preserves scalar multiplication

$$f(\lambda r(x)) = f(\lambda a_0 + \lambda a_1 x^1 + \lambda a_2 x^2 + \dots)$$

$$= 0 + \lambda a_0 x^1 + \lambda a_1 x^2 + \lambda a_2 x^3 + \dots$$

$$= \lambda (0 + a_0 x^1 + a_1 x^2 + a_2 x^3 + \dots)$$

$$= \lambda f(r(x))$$

3. Show that the space of functions  $f: \mathbb{N} \to \mathbb{R}$  does not have a countable basis.

4. Let  $\mathbb{F}$  be a field and f(x) be an irreducible polynomial in  $\mathbb{F}[x]$ . Show that the set of polynomials modulo f(x) form a field.

5. (a) A non-empty subset I of a ring R is an ideal if for all  $s,t\in I$  and all  $r\in R$  we have

$$s-t \in I$$
 and  $rt, tr \in I$ .

List all the ideals of a field  $\mathbb{F}$  and of the ring  $\mathbb{Z}$ . Show that the kernel of any ring homomorphism is an ideal.

- (b) Show that (r+I)(r'+I) := rr' + I gives a well defined multiplication on the set of cosets R/I making it into a ring.
- (c) Formulate the first isomorphism theorem for rings.

- 6. (a) Show that the set  $M_n(R)$  of  $(n \times n)$ -matrices with entries in a ring R is a ring with the usual matrix addition and multiplication.
- (b) Show that the canonical surjection  $R \to R/I$  induces a surjective ring homomorphism  $M_n(R) \to M_n(R/I)$ . What is the kernel? Consider the example when  $R = \mathbb{Z}$  and  $I = 3\mathbb{Z}$ .
- (c) Describe the ideals of  $M_n(R)$  for a ring R with multiplicative unit 1.

7. Prove that a linear transformation  $P: V \to V$  of a finite dimensional vector space satisfies  $P^2 = P$  if and only if there exists a basis such that the matrix of P with respect to that basis is a block matrix

$$\left(\begin{array}{cc} I & 0 \\ 0 & 0 \end{array}\right).$$

Hence determine the minimal and characteristic polynomials of P.

8. Let  $T: V \to V$  be a linear transformation of a finite dimensional vector space over a field  $\mathbb{F}$  to itself. Prove that T is invertible if and only if x does not divide the minimal polynomial  $m_T(x)$ .

- 9. Let  $T: V \to V$  be a linear transformation of a finite dimensional vector space over a field  $\mathbb{F}$  to itself. Assume that  $\{v, Tv, T^2v, \dots\}$  span V for some  $v \in V$ . Show that
  - (i) there exists a k such that  $v, Tv, \dots, T^{k-1}v$  are linearly independent and for some  $\alpha_i \in \mathbb{F}$

$$T^k v = \alpha_0 v + \alpha_1 T v + \dots + \alpha_{k-1} T^{k-1} v;$$

- (ii) the set  $\{v, Tv, \dots, T^{k-1}v\}$  forms a basis for V;
- (iii) its minimal polynomial is given by  $m_T(x) = x^k \alpha_{k-1}x^{k-1} \cdots \alpha_0$ .

What is the characteristic polynomial  $\chi_T(x)$ ?
